Presentation template

Ivan Trepakov

Sample slide

First column

- You can use all Markdown features and directly embed LaTeX

Second column

- Markdown lists
- With beautiful math: $x^n + y^n = z^n$
- And *easy* **Markdown** `styles`

Sample slide

First column

- You can use all Markdown features and directly embed LaTeX
- Beamer allows you to flexibly animate slides with `\uncover<X>` and `\only<X>`

Second column

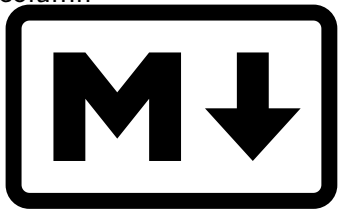
- Markdown lists
- With beautiful math: $x^n + y^n = z^n$
- And *easy* **Markdown** `styles`

Sample slide

First column

- You can use all Markdown features and directly embed LaTeX
- Beamer allows you to flexibly animate slides with `\uncover<X>` and `\only<X>`
- For images it is better to use vector graphics, e.g. in `.svg` which is automatically converted into `.pdf` via `Makefile` magic

Second column

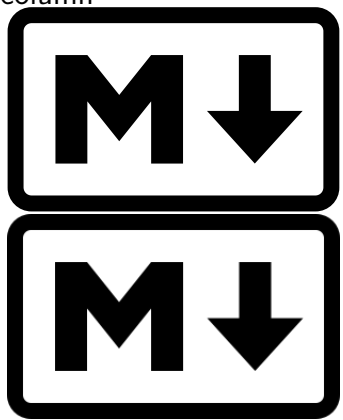


Sample slide

First column

- You can use all Markdown features and directly embed LaTeX
- Beamer allows you to flexibly animate slides with `\uncover<X>` and `\only<X>`
- For images it is better to use vector graphics, e.g. in `.svg` which is automatically converted into `.pdf` via `Makefile` magic
- You can also use `.png` or `.jpg` but they usually look worse than `.svg`/`.pdf`

Second column

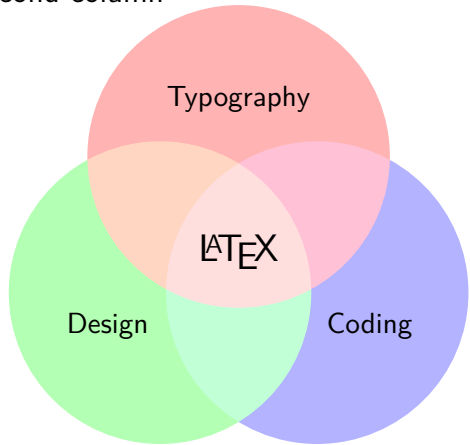


Sample slide

First column

- You can use all Markdown features and directly embed LaTeX
- Beamer allows you to flexibly animate slides with `\uncover<X>` and `\only<X>`
- For images it is better to use vector graphics, e.g. in `.svg` which is automatically converted into `.pdf` via `Makefile` magic
- You can also use `.png` or `.jpg` but they usually look worse than `.svg`/`.pdf`
- Or you can dive deep into Ti*k*Z

Second column



Conclusion

Summary

- Pandoc = Markdown + LaTeX
- Please use this template and never open ~~Google Slides~~ PowerPoint ever again

Thank you for your attention
